Steel for the reinforcement and prestressing of concrete — Test methods —

Part 3: Prestressing steel

The European Standard EN ISO 15630-3:2002 has the status of a
British Standard

ICS 77.140.99; 91.080.40

azmanco.com

National foreword

This British Standard is the official English language version of EN ISO 15630-3:2002. It is identical with ISO 15630-3:2002.

The UK participation in its preparation was entrusted by Technical Committee ISE/9, Steel for concrete reinforcement, to Subcommittee ISE/9/4, Prestressing steels for concrete, which has the responsibility to:

— aid enquirers to understand the text;

— present to the responsible international/European committee any enquiries on the interpretation, or proposals for change, and keep the UK interests informed;

— monitor related international and European developments and promulgate them in the UK.

A list of organizations represented on this subcommittee can be obtained on request to its secretary.

Cross-references

The British Standards which implement international or European publications referred to in this document may be found in the BSI Standards Catalogue under the section entitled "International Standards Correspondence Index", or by using the "Find" facility of the BSI Standards Electronic Catalogue.

A British Standard does not purport to include all the necessary provisions of a contract. Users of British Standards are responsible for their correct application.

Compliance with a British Standard does not of itself confer immunity from legal obligations.

This British Standard, having been prepared under the direction of the Engineering Sector Policy and Strategy Committee, was published under the authority of the Standards Policy and Strategy Committee on 30 May 2002

This European Standard was approved by CEN on 11 April 2002.

CEN members are bound to comply with the CEN/CENELEC Internal Regulations which stipulate the conditions for giving this European Standard the status of a national standard without any alteration. Up-to-date lists and bibliographical references concerning such national standards may be obtained on application to the Management Centre or to any CEN member.

This European Standard exists in three official versions (English, French, German). A version in any other language made by translation under the responsibility of a CEN member into its own language and notified to the Management Centre has the same status as the official versions.

CEN members are the national standards bodies of Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Malta, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and United Kingdom.

Foreword

This document (ISO 15630-3:2002) has been prepared by Technical Committee ISO/TC 17 "Steel" in collaboration with Technical Committee ECISS/TC 19 "Concrete reinforcing and prestressing steels - Properties, dimensions, tolerances and specific tests", the secretariat of which is held by DIN.

This European Standard shall be given the status of a national standard, either by publication of an identical text or by endorsement, at the latest by October 2002, and conflicting national standards shall be withdrawn at the latest by October 2002.

According to the CEN/CENELEC Internal Regulations, the national standards organizations of the following countries are bound to implement this European Standard: Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, Malta, Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

Endorsement notice

The text of the International Standard ISO 15630-3:2002 has been approved by CEN as a European Standard without any modifications.

NOTE   Normative references to International Standards are listed in annex ZA (normative).

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 3.

The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least 75 % of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this part of ISO 15630 may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO 15630-3 was prepared by Technical Committee ISO/TC 17, *Steel*, Subcommittee SC 16, *Steels for the reinforcement and prestressing of concrete*.

This part of ISO 15630, together with parts 1 and 2, cancels and replaces ISO 10065:1990, ISO 10287:1992 and ISO 10606:1995.

ISO 15630 consists of the following parts, under the general title *Steel for the reinforcement and prestressing of concrete — Test methods*:

— *Part 1: Reinforcing bars, wire rod and wire*

— *Part 2: Welded fabric*

— *Part 3: Prestressing steel*

azmanco.com

Introduction

The aim of ISO 15630 is to provide all relevant test methods for reinforcing and prestressing steels in one standard. In that context, the existing International Standards for testing these products have been revised and updated. Some further test methods have been added.

Reference is made to International Standards on testing of metals in general as they are applicable. Complementary provisions have been given if needed.

Test methods which do not form the subject of an existing International Standard on metal testing are fully described in ISO 15630.

Steel for the reinforcement and prestressing of concrete — Test methods —

Part 3:
Prestressing steel

1 Scope

This part of ISO 15630 specifies test methods applicable to prestressing steels (bar, wire or strand).

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this part of ISO 15630. For dated references, subsequent amendments to, or revisions of, any of these publications do not apply. However, parties to agreements based on this part of ISO 15630 are encouraged to investigate the possibility of applying the most recent editions of the normative documents indicated below. For undated references, the latest edition of the normative document referred to applies. Members of ISO and IEC maintain registers of currently valid International Standards.

See Table 1.

Table 1 — Symbols

Symbol	Unit	Description	Reference
a_m	mm	Rib height at the mid-point	13.3, 14.2
a_{max}	mm	Maximum height of rib or depth of indentation	13.3
$a_{s,i}$	mm	Average height of a portion i of a rib subdivided in p parts of length Δl	14.2
$a_{1/4}$	mm	Rib height at the quarter-point	13.3, 14.2
$a_{3/4}$	mm	Rib height at the three-quarters point	13.3, 14.2
A_{gt}	%	Percentage total elongation at maximum force	5
c	mm	Rib or indentation spacing	13.3
C	mm	Groove width at nominal diameter of the mandrel, d_a, used for the deflected tensile test	11.3.4
d	mm	Nominal diameter of the bar, wire or strand	9.2, 9.4.6, 10.3.4
d_a	mm	Nominal diameter of the mandrel used for the deflected tensile test	11.3.4
d_b	mm	Diameter with 2 gauge cylinders in the groove of the mandrel used for the deflected tensile test	11.3.4
d_e	mm	Diameter of the gauge cylinder used for the deflected tensile test	11.3.4
d_i	mm	Inner diameter of the groove of the mandrel used for the deflected tensile test	11.3.4
D	%	Average coefficient of reduction of the maximum force in the deflected tensile test	11.2, 11.4
D_c	mm	Inner diameter of the cell in the stress corrosion test	10.3.4
D_i	%	Individual percentage of reduction of the maximum force in the deflected tensile test	11.4
e	mm	Average gap between two adjacent rib or indentation rows	13.3.1.4, 13.3.2.4
E	N/mm^2	Modulus of elasticity	5.3
f	Hz	Frequency of load cycles in the axial load fatigue test	9.1, 9.4.2
f_R	1	Relative rib area	Clause 14
$F_{a,i}$	N	Individual breaking force in the deflected tensile test	11.4
F_m	N	Maximum force	5.3
$F_{m,m}$	N	Mean value of the maximum force	8.2, 10.2, 11.2
$F_{p0,1}$	N	0,1 % proof force	5.3
$F_{p0,2}$	N	0,2 % proof force	5.3
F_r	N	Force range in the axial load fatigue test	9.1, 9.3, 9.4.2
F_{rt}	N	Residual force in the test piece at time t in the relaxation test	8.1
ΔF_{rt}	N	Force loss in the test piece at time t in the relaxation test	8.1
F_R	mm^2	Area of longitudinal section of a rib	14.2
F_{up}	N	Upper force in the axial load fatigue test	9.1, 9.3, 9.4.2

Table 1 (*continued*)

Symbol	Unit	Description	Reference
F_0	N	Initial force in the isothermal stress relaxation test and the stress corrosion test	8.1, 8.3, 8.4, 10.4.2
G	mm	Depth of the groove of the mandrel used for the deflected tensile test	11.3.4
h_b	mm	Bow height in the plane of the bow	13.3.4
L_t	mm	Length of the test piece in the stress corrosion test	10.2
L_0	mm	Gauge length (without force on the test piece) in the isothermal stress relaxation test	8.1, 8.3, 8.4
		Length of the test piece in contact with the solution in the stress corrosion test	10.2, 10.3.4, 10.4.5
ΔL_0	mm	Elongation of the gauge length, L_0, under force, F_0, in the isothermal stress relaxation test	8.1, 8.3, 8.4
L_1	mm	Length of the passive side in the deflected tensile test	11.3.2
L_2	mm	Length of the active side in the deflected tensile test	11.3.2
P	mm	Lay length of a strand	13.3.3
R	mm	Radius at the base of the mandrel used for the deflected tensile test	11.3.4
Ra	µm	Surface roughness of the mandrel used for the deflected tensile test	11.3.4
S_n	mm^2	Nominal cross-sectional area of the test piece	5.3.2
t_a	h	Maximum agreed time for the stress corrosion test	10.4.5
$t_{f,i}$	h	Individual lifetime to fracture in the stress corrosion test	10.4.5
$t_{f,m}$	h	Median lifetime to fracture in the stress corrosion test	10.4.6
t_0	s	Starting time in the isothermal stress relaxation test and in the stress corrosion test	8.4.2, 10.4
V_0	mm^3	Volume of test solution to fill the test cell in the stress corrosion test	10.4.3
α	°	Angle of deviation in the deflected tensile test	11.3.2
β	°	Rib or indentation angle to the bar or wire axis	13.3
ρ	%	Relaxation	8.4.8
Σe_i	mm	Part of the circumference without indentation or rib	13.3.1.4, 13.3.2.4, 14.2
NOTE		1 N/mm^2 = 1 MPa.	

4   General provisions concerning test pieces

Unless otherwise agreed, the pieces shall be taken from the finished product normally before packaging.

Special care should be taken when sampling is made from the packaged product (e.g. coil or bundle), in order to avoid plastic deformation which could change the properties of the samples used to provide the test pieces.

NOTE   Specific complementary provisions concerning the test pieces may be indicated in the relevant clauses, when applicable.

azmanco.com

5   Tensile test

5.1   Test piece

The general provisions given in clause 4 apply.

5.2   Test equipment

The test equipment shall be verified and calibrated in accordance with ISO 7500-1 and shall be at least of class 1.

When an extensometer is used, it shall be of class 1 (see ISO 9513) for the determination of $F_{p0,1}$ or $F_{p0,2}$; for the determination of A_{gt}, a class 2 extensometer (see ISO 9513) may be used.

Suitable grips shall be used to avoid breaks in or very near the grips.

5.3   Test procedure

5.3.1   General

The tensile test shall be carried out in accordance with ISO 6892:1998.

An extensometer shall be used for the determination of the modulus of elasticity (E), 0,1 % and 0,2 % proof force ($F_{p0,1}$ and $F_{p0,2}$) and percentage total elongation at maximum force (A_{gt}). The extensometer gauge length shall be as given in the relevant product standard.

NOTE 1   Accurate values of A_{gt} can only be obtained with an extensometer. If it is not possible to leave the extensometer on the test piece to fracture, the elongation may be measured as follows:

— continue loading until the extensometer records an elongation just greater than the elongation corresponding to $F_{p0,2}$, at which the extensometer is removed and the distance between the testing machine cross-heads noted. The loading is continued until fracture occurs. The final distance between the cross-heads is noted;

— the difference between the cross-heads measurements is calculated as a percentage of the original distance between the cross-heads and this value is added to the percentage obtained by extensometer.

For wire and bars, it is also permissible to determine A_{gt} by drawing equidistant marks on the free length of the test piece (see annex H of ISO 6892:1998). The distance between the marks should be 20 mm, 10 mm or 5 mm, depending on the wire or bar diameter.

NOTE 2   It is preferable to preload the test piece, e.g. to about 0,1 of the expected maximum force before placing the extensometer.

If A_{gt} is not completely determined with an extensometer, this shall be indicated in the test report.

Tensile properties, $F_{p0,1}$, $F_{p0,2}$, F_m, are recorded in force units.

When the rupture occurs within a distance of 3 mm from the grips, the test shall, in principle, be considered as invalid and it shall be permissible to carry out a retest. However, it shall be permitted to take into account the test results if all values are greater than or equal to the relevant specified values.

5.3.2   Determination of the modulus of elasticity

The modulus of elasticity (E) shall be determined from the slope of the linear portion of the force-extension diagram in the range between $0,2\ F_m$ and $0,7\ F_m$ divided by the nominal cross-sectional area of the test piece (S_n).

The slope may be calculated either by a linear regression of the measured data stored in a data storage facility or by a best fit visual technique over the above defined portion of the registered curve.

NOTE   In some special cases, e.g. hot-rolled and stretched bars, the above mentioned method cannot be applied; a secant modulus between 0,05 F_m and 0,7 F_m may then be determined.

In addition to the provisions given in 5.3.1, it shall be ensured that the stress rate shall not be changed within the force range over which the modulus of elasticity is determined.
6   Bend test

6.1   Test piece

The general provisions given in clause 4 apply.

6.2   Test equipment

6.2.1   A bending device, the principle of which is shown in Figure 1, shall be used.

NOTE   Figure 1 shows a configuration where the mandrel and support rotate and the carrier is locked. It is also possible that the carrier rotates and the support or mandrel is locked.

Key

1   Mandrel
2   Support
3   Carrier

Figure 1 — Principle of a bending device

6.2.2   The bend test may also be carried out by using a device with supports and a mandrel (see 4.1 of ISO 7438:1985).

6.3   Test procedure

The bend test shall be carried out at a temperature between 10 °C and 35 °C. The test piece shall be bent over a mandrel.

NOTE   The bending rate should be about 60°/s.

The angle of bend and the diameter of the mandrel shall be in accordance with the relevant product standard.

6.4   Interpretation of test results

The interpretation of the bend test shall be carried out according to the requirements of the relevant product standard.

When these requirements are not specified, the absence of cracks visible to a person with normal or corrected vision is considered as evidence that the test piece withstood the bend test.

azmanco.com

7   Reverse bend test

7.1   Test piece

In addition to the general provisions given in clause 4, the test piece shall comply with clause 5 of ISO 7801:1984.

7.2   Test equipment

The test equipment shall comply with clause 4 of ISO 7801:1984.

7.3   Test procedure

The reverse bend test shall be carried out according to ISO 7801:1984.

8   Isothermal stress relaxation test

8.1   Principle of test

The isothermal stress relaxation test consists of measuring, at a given temperature (generally fixed at 20 °C unless otherwise agreed) the variations of force of a test piece maintained at constant length ($L_0 + \Delta L_0$), from an initial force (F_0) (see Figure 2).

The loss in force is expressed as a percentage of the initial force for a given period of time.

Figure 2 — Principle of the isothermal stress relaxation test

6

azmanco.com

8.2 Test piece

The general provisions given in clause 4 apply.

The test piece for the relaxation test shall be maintained in a straight condition. The free length of the test piece between the grips shall not be subjected to any mechanical deformation or treatment of any kind.

Two test pieces adjacent to the test pieces for the stress relaxation test shall be taken for the determination of the mean value of maximum force ($F_{m, m}$), when the initial force, F_0, is expressed as a percentage of $F_{m, m}$, e.g. 70 % $F_{m, m}$.

8.3 Test equipment

8.3.1 Frame

Any deformation of the frame shall be within such limits that it does not influence the results of the test.

8.3.2 Force-measuring device

The force shall be measured either by a coaxial load cell or another appropriate device (e.g. lever loading system).

The load cell shall be calibrated in accordance with ISO 7500-1:1999 and have an accuracy of $\pm$ 1 % for forces up to 1 000 kN and $\pm$ 2 % for forces greater than 1 000 kN.

Any other appropriate device shall provide the same accuracy as the one specified for the load cell.

The resolution of the output of the force-measuring device shall be $5 \times 10^{-4} F_0$ or better.

8.3.3 Length measuring device (extensometer)

The gauge length (L_0) shall be not less than 200 mm and particularly for strands, should preferably be of the order of 1 000 mm or of an integer number of the strand lay length when the actual length ($L_0 + \Delta L_0$) is measured on the same wire of the strand. The extensometer shall have an accuracy of at least $\pm$ 1 % and shall have an output or calibration of scale capable of a resolution of $5 \times 10^{-6} L_0$.

8.3.4 Anchoring device

The anchoring device shall be constructed in such a way that slipping during the test is either not possible or is corrected and rotation is prevented.

8.3.5 Loading device

The loading device shall allow smooth increase of loading the test piece without shock. It shall be constructed in such a way that the length ($L_0 + \Delta L_0$) can be maintained within the limits fixed in 8.4.5, throughout the test, by reduction of force.

8.4 Test procedure

8.4.1 Provisions concerning the test piece

The test piece shall stay at least 24 h in the testing laboratory prior to the test.

The test piece shall be securely gripped in the anchorages of the test device in order to avoid any slip during loading and during the test.

azmanco.com

8.4.2 Application of force

Application of force shall at all times be carried out smoothly and without shock.

The loading up to 20 % of the initial force, F_0, may be carried out as desired. Loading of the test piece from 20 % up to 80 % of F_0 shall be applied continuously or in three or more uniform steps or with a uniform rate of loading and shall be completed within 6 min. Application of the force between 80 % and 100 % of F_0 shall be continuous and shall be completed within 2 min, after achievement of 80 % of F_0.

On attainment of the initial force, F_0, the force shall be kept constant for a period of 2 min. Immediately on completion of this 2 min period, time, t_0, is established and recorded. Any subsequent adjustment of force shall only be made in order to ensure that $L_0 + \Delta L_0$ is kept constant.

The application of force is illustrated schematically in Figure 3.

Figure 3 — Application of force in the relaxation test

8.4.3 Initial force

The initial force shall be as specified in the appropriate product standard. The measured value of the initial force shall be within the tolerances of the specified value given in Table 2.

Table 2 — Tolerance of F_0

Value of F_0	Tolerance of F_0
$F_0 \leqslant 1\ 000$ kN	$\pm\ 1$ %
$F_0 > 1\ 000$ kN	$\pm\ 2$ %

8.4.4 Force during the test

At any time the force shall not be permitted to exceed the initial force by more than the tolerances given in Table 2.

8

8.4.5   Maintenance of strain

The strain imposed by the initial force, F_0, at time, t_0, shall be measured with a suitable mechanical, electrical or optical extensometer having the precision defined in 8.3.3 at the selected initial gauge length, L_0. The variation of $\Delta L_0/L_0$ shall not exceed 5×10^{-6} during the measurement and 5×10^{-5} between two consecutive measurements.

8.4.6   Temperature

The temperature of the testing laboratory shall be such that the temperature of the test piece shall be maintained within 20 °C $\pm$ 2 °C.

8.4.7   Frequency of force recording

The loss of force shall be continuously recorded or measured at least approximately at the standard time intervals given in Table 3 after starting the test and then at least once per week.

Table 3 — Standard times of force recording

Minutes	1	2	4	8	15	30	60
Hours	2	4	6	24	48	96	120

8.4.8   Duration of the test

The duration of the test shall be $\geqslant$ 120 h.

NOTE 1   Common duration of a test is 120 h or 1 000 h.

NOTE 2   The value of stress relaxation at 1 000 h (or more) may be extrapolated from tests terminating at not less than 120 h, where adequate evidence is provided that the extrapolated 1 000 h (or more) value is equivalent to the actual 1 000 h (or more) value. In this case, the extrapolation method should be described in the test report.

A current method of extrapolation is based on the formula:

$$\log \rho = A \log t + B$$

where ρ is the relaxation generally expressed in % and t is the time expressed in hours.

9   Axial load fatigue test

9.1   Principle of test

The axial load fatigue test consists of submitting the test piece to an axial tensile force, which varies cyclically according to a sinusoidal wave-form of constant frequency, f, in the elastic range (see Figure 4). The test is carried out until failure of the test piece or until reaching, without failure, the number of load cycles specified in the relevant product standard.
azmanco.com

Figure 4 — Load cycle diagram

9.2 Test piece

The general provisions given in clause 4 apply.

The free length shall be in accordance with Table 4.

Table 4 — Free length of the test piece

Wire and bar	140 mm or 14d, whichever is the greater
Strand	500 mm or twice the lay length, whichever is the greater

The free length of the test piece between the grips shall not be subjected to treatment of any kind.

9.3 Test equipment

The fatigue testing machine shall be calibrated in accordance with ISO 4965. The accuracy shall be at least ± 1 %. The testing machine shall be capable of maintaining the upper force (F_{up}) to within ± 2 % of the specified value and the force range (F_r) to within ± 4 % of the specified value.

9.4 Test procedure

9.4.1 Provisions concerning the test piece

The test piece shall be gripped in the test equipment in such a way that force is transmitted axially and free of any bending moment along the test piece. For strands, it is essential that all constituent wires be equally gripped and the force equally distributed amongst them.

9.4.2 Stability of force and frequency

The test shall be carried out under conditions of stable upper force (F_{up}), force range (F_r) and frequency (f). There shall be no interruptions in the cyclic loading throughout the test. However, it is permissible to continue a test which is accidentally interrupted. Any interruption shall be reported.

9.4.3 Counting of load cycles

The number of load cycles shall be counted inclusively from the first full load range cycle.

9.4.4 Frequency

The frequency of load cycles shall be stable during the test and shall be maintained during a test series. It shall not exceed:

a) 120 Hz for wire and bar;

b) 20 Hz for strand.

9.4.5 Temperature

The temperature of the test piece shall not exceed 40 °C throughout the test. The temperature of the testing laboratory shall be between 10 °C and 35 °C, unless otherwise specified. For tests carried out under controlled conditions, the temperature of the testing laboratory shall be (23 ± 5) °C.

9.4.6 Termination of the test

The test shall be terminated upon failure of the test piece or fracture of one or more wires in the case of a strand or on completion of the specified number of cycles without failure.

9.4.7 Validity of the test

If failure occurs in the grips or within a distance of $2d$ of the grips or initiates at an exceptional feature of the test piece, the test may be considered as invalid.

10 Stress corrosion test in a solution of thiocyanate

10.1 Principle of test

The test determines the time to fracture of a test piece maintained at a constant tensile force and immersed in a solution of thiocyanate (see 10.3.5), at a given constant temperature.

10.2 Sample and test piece

The general provisions given in clause 4 apply to the sample which should provide not less than 6 test pieces for the stress corrosion test and 2 test pieces for the determination of $F_{m, m}$ by a uniaxial tensile test when the initial force (F_0) is expressed as a percentage of $F_{m, m}$, e.g. 80 % $F_{m, m}$.

The length of a test piece, L_t, shall be sufficient to ensure that any bending from the anchorage is minimized and should be preferably twice the length, L_0.

10.3 Test equipment

10.3.1 Frame

A stiff frame shall be used. Loading shall be applied by a lever apparatus or by a hydraulic or mechanical device acting on a closed frame in either horizontal or vertical orientation.

10.3.2 Force measuring device

A force measuring device with an accuracy of at least $\pm$ 2 % shall be used and calibrated in accordance with ISO 7500-1.

10.3.3 Time measuring device

The time shall be measured with a resolution of at least 0,01 hour. The time measuring device shall be equipped with an automatic control to stop and retain or record the time at fracture with an accuracy of $\pm$ 0,1 h. Alternatively, the time to fracture shall be the last manually recorded time prior to fracture.

10.3.4 Cell containing the test solution

The cell containing the test solution should preferably be cylindrical and sealed at both ends. It shall have an inner diameter, D_c, in accordance with the following formula:

$$D_c \geqslant \sqrt{(200 + d) \times d} \text{ (all dimensions in mm)}$$

Recommended inner diameters, D_c, are given in Table 5.

Table 5 — Recommended inner diameters, D_c, of the test cell

Dimensions in millimetres

Diameter of the test piece, d	Recommended values of D_c
$d \leqslant 19$	min. 70
$19 < d \leqslant 50$	min. 100

The cell length shall be sufficient to accomodate a test length, L_0, of at least 200 mm.

The cell shall be manufactured from a material which is chemically resistant to the test solution at 50 °C.

The cell shall be kept closed during the test and admission of air shall be avoided.

10.3.5 Test solution

The test solution can be selected from one of the two specified below which present respectively a high and low concentration of thiocyanate:

— solution A: aqueous solution of ammonium thiocyanate prepared by dissolving 200 g of NH_4SCN in 800 ml of distilled water or demineralized water. The ammonium thiocyanate shall be of analytical grade containing at least 99 % of NH_4SCN and a maximum of 0,005 % Cl^-, 0,005 % SO_4^{2-} and 0,001 % S^{2-};

— solution B: aqueous solution of potassium sulfate (K_2SO_4), potassium chloride (KCl) and potassium thiocyanate (KSCN) prepared with distilled water or demineralized water. Test solution B shall contain 5 g of SO_4^{2-}, 0,5 g of Cl^- and 1 g of SCN^-.

The electrical conductivity of the water used for the preparation of solutions A and B shall not exceed 20 µS/cm.

NOTE   Attention is drawn to the fact that these two solutions give different results which are not comparable.

10.4 Test procedure

10.4.1 Provisions concerning the test pieces

The test pieces shall be cleaned by wiping with a soft cloth and degreased, e.g. with acetone (CH_3COCH_3) and dried in air.

azmanco.com

The test piece shall be protected from corrosion by varnish or similar means in the zones where the test piece enters the test cell and for at least 50 mm into the inner part of the cell. The test length (L_0) is the length of the test piece in contact with the solution.

10.4.2 Application and maintenance of force

The test piece is placed in the tensioning frame and the cell placed on the test piece. Force shall be applied to the test piece until F_0 is reached.

The indicated force for F_0 shall be maintained within $\pm$ 2 % for the duration of the test.

The value for F_0 shall be recorded at time, t_0, and shall be confirmed and, if necessary, adjusted at appropriate intervals during the test.

10.4.3 Filling of the cell

Upon completion of loading, the cell shall be sealed to prevent leakage and a volume, V_0, of test solution, which shall be a new one for each test, preheated to a temperature between 50 °C and 55 °C introduced into the cell. V_0 shall be at least 5 ml per cm^2 of surface area of the test piece along the test length, L_0. Filling of the cell shall be finished within one minute and then the time measuring device set to the starting time, t_0.

The solution shall not be circulated during the test.

10.4.4 Temperature during the test

Within the time interval t_0 and (t_0 + 5) min, the temperature of the test solution shall be adjusted to (50 $\pm$ 1) °C for wires and strands and (50 $\pm$ 2) °C for bars and shall be maintained in the relevant range throughout the test.

10.4.5 Termination of the test

The test shall be considered to have reached completion either on fracture of the test piece or at an agreed time, t_a.

In the case of strands, the test shall be considered to have reached completion when at least one wire is broken. If fracture of the test piece occurs outside the test length, L_0, the test shall be considered as invalid.

The time to fracture, $t_{f,i}$, shall be measured and recorded to the nearest 0,1 h. If fracture has not occurred within the time, t_a, the result shall be recorded as $t_{f,i} > t_a$.

10.4.6 Determination of median lifetime to fracture ($t_{f,m}$)

When all the test pieces in the series have been tested, the results $t_{f,i}$ shall be ordered according to the values of lifetime to fracture. The median value ($t_{f,m}$) is that in the middle of this ordered series, or the arithmetic mean of the two in the middle if there is an even number of test results.

11 Deflected tensile test

11.1 Principle of test

The test consists of determining the reduction coefficient of the maximum force in uniaxial tension due to a deviation of 20° around a specified mandrel, for 5 test pieces of a sample of strand with a nominal diameter equal to or greater than 12,5 mm.

azmanco.com

11.2 Sample and test piece

The general provisions given in clause 4 apply to a sample of sufficient length to provide at least 12 test pieces.

One test piece taken from each end of the sample shall be used in the uniaxial tensile tests to determine $F_{m,m}$.

The remainder of the test sample shall be cut into at least 10 test pieces for deflected tensile tests.

NOTE   Five valid test results are sufficient to calculate the D-value (see 11.4). But as invalid tests can occur, it is suggested that at least 10 available test pieces be provided.

The length of each test piece shall be appropriate to the testing and anchoring device.

The test pieces shall not be subject to any treatment or preparation other than cutting.

11.3 Test equipment

11.3.1 General description

The test machine shall have a stiff frame and shall fulfil the requirements stated in 11.3.2 to 11.3.5. The test machine consists of a fixed passive anchorage, a movable active anchorage to which a force measuring device is attached, a loading device and a fixed grooved mandrel of specified dimensions.
11.3.2 Dimensions

The dimensions of the test device shown in Figure 5 shall be as follows:

L_1: (700 ± 50) mm;

L_2: $\geqslant 750$ mm;

α: $20° \pm 0{,}5°$.

The axis of the mandrel shall be perpendicular to the plane formed between the active and the passive anchorage sides and the centre of the mandrel.

4   Anchorage

Figure 5 — Main dimensions of the deflected tensile test device

azmanco.com

11.3.3 Anchorages

The longitudinal axis of both ends of the test piece shall be perpendicular to the plane of bearings for the anchorages. Inadequate geometrical position may cause incorrect test results.

The anchorages shall fulfil the following requirements:

— uniaxial tensile tests with the anchorages (wedges and dies) used in the deflected tensile tests shall provide at least 95 % of the maximum force in the uniaxial tensile test carried out in accordance with clause 5;

— axial displacement of the centre wire in relation to the outer wires of the strand shall be less than 0,5 mm at 90 % of the maximum force in the uniaxial tensile test;

— displacement of the wedges in the anchorage body shall be less than the values given in Table 6;

— the contact between conical part of the die and wedges shall be secured during the test;

— the toothed part of the wedges shall have a minimum length of 2,5 to 3 times the strand diameter.

Table 6 — Displacement of wedges

Percentage of maximum force	Admissible maximum displacement [a]
from 0 % to rupture	5 mm
from 50 % to rupture	2,5 mm
[a] Bedding-in of the wedges prior to the beginning of the test shall be disregarded.	

11.3.4 Mandrel

The mandrel shall be made of tool steel. The chemical composition, microstructure and heat treatment shall be such that it is ductile and has a high wear resistance.

The surface hardness shall be 58 HRC to 62 HRC measured in accordance with ISO 6508-1.

The surface finish of the fresh mandrel groove shall have a roughness, Ra, of maximum 1,6 µm. Ra is defined in ISO 4287.

The dimensions of the mandrel (see Figure 6) are given in Table 7.

azmanco.com

Table 7 — Dimensions of the mandrel

Dimensions in millimetres

Parameter	Strand diameter		
	12,5 to 13,0	15 to 16	17 to 18
Nominal mandrel diameter, d_a	40	49	59
Angle of the groove flanks	60° ± 12′	60° ± 12′	60° ± 12′
Radius at the base of the groove, R	2 ± 0,2	2 ± 0,2	2 ± 0,2
Depth of the groove, G	7,6	9,5	12
Groove width, C, at nominal mandrel diameter, d_a	14,4	17,9	21,9
Inner diameter, d_i, of the groove	24,7 ± 0,1	29,9 ± 0,1	34,9 ± 0,1
Diameter with 2 cylinders in the groove, d_b	57,0 ± 0,1	72,0 ± 0,1	81,0 ± 0,1
Diameter of gauge cylinder, d_e	14	18	20

The mandrel shall be rigidly fixed in such a way that any rotation or other movement is impossible.

Figure 6 — Mandrel

azmanco.com

11.3.5 Loading device

The loading equipment, preferably using a load cell, shall be calibrated in accordance with ISO 7500-1. Accuracy shall be at least ± 1 % of the indicated force for forces ⩾ 10 % of the total force range.

The loading rate shall be adjustable. This rate shall be controlled during the test so that when the force rises to 50 % of the anticipated breaking force, the rate shall be in the range 30 N/mm^2/s to 60 N/mm^2/s. This rate shall then be maintained until fracture occurs.

11.4 Test procedure

The surface of the mandrel groove shall be carefully cleaned before starting any test. If the strand is slightly curved, the test piece shall be laid into the groove in such a way that the curvature is in the same direction as the deflection during the test.

Proper alignment of the test piece shall be verified after installation in the anchorages and before application of any force. During loading, the grip efficiency of the anchorages shall be checked to verify that there is no slip between the strand and the anchorage grips.

The loading rate shall conform with 11.3.5.

A test shall be considered as invalid when the rupture of one or more wires of the strand does not occur at the contact with the mandrel.

The value of $F_{a,i}$ for a valid test shall be recorded with the accuracy as indicated in 11.3.5. The corresponding value D_i shall be calculated from $F_{a,i}$ as follows and shall be reported:

$$D_i = (1 - F_{a,i} / F_{m,m}) \times 100 \text{ in %}$$

The D-value shall be calculated as the average of the five D_i values:

$$D = \frac{1}{5} \sum_{i=1}^{5} D_i$$

12 Chemical analysis

In general, the chemical composition is determined by spectrometric methods.

In the case of dispute about analytical methods, the chemical composition shall be determined by an appropriate referee method specified in one of the International Standards listed in ISO/TR 9769:1991.

13 Measurement of the geometrical characteristics

13.1 Test piece

The general provisions given in clause 4 apply.

The length of the test piece shall be sufficient to carry out the measurements in accordance with 13.3.

azmanco.com

13.2 Test equipment

The geometrical characteristics shall be measured with an instrument of a resolution of at least:

— 0,01 mm for the height of ribs (for bars or quenched and tempered wire) and the depth of indentations (for indented cold-drawn wire);

— 0,05 mm for the gap between the ribs or indentations of two adjacent rib or indentation rows;

— 0,5 mm for the measurement of the distance between ribs or indentations when determining the rib or indentation spacing (see 13.3.1.3 and 13.3.2.2) or of the lay length for strands (see 13.3.3);

— one degree for the inclination between the rib or indentation and the longitudinal axis of the wire or bar.

13.3 Test procedures

13.3.1 Rib measurements

13.3.1.1   Height at the highest point (a_{max})

The rib height at the highest point (a_{max}) shall be determined by measuring the height of n ($n \geqslant 5$) individual ribs in each row at their highest point and calculating the mean of all obtained individual values.

13.3.1.2   Rib height at a given position

The rib height at a given position, e.g. at the quarter-point or at the mid-point or at the three-quarters point, respectively designated $a_{1/4}$, a_m and $a_{3/4}$, shall be determined by measuring the height of n ($n \geqslant 3$) individual ribs in each row and calculating the mean of all obtained individual values.

13.3.1.3   Rib spacing (c)

The rib spacing (c) shall be determined from the length of the measured distance divided by the number of rib gaps.

The measured distance is deemed to be the interval between the centre of a rib and the centre of another rib on the same row of the product determined in a straight line and parallel to the longitudinal axis of the product. The length of the measured distance shall be at least 10 rib gaps.

13.3.1.4   Part of the circumference without ribs (Σe_i)

The part of the circumference without ribs (Σe_i) shall be determined as the sum of the average gap (e) between ribs of two adjacent rib rows, for each rib row.

e shall be determined from at least 3 measurements.

13.3.1.5   Rib inclination angle (β)

The rib inclination angle (β) shall be determined as the mean of the individual angles measured for each row of ribs with the same angle.

13.3.2 Indentation measurements

13.3.2.1   General

Measurements on indented strand shall be made on each individual wire from the test piece. Prior to measurement, the individual wires shall be separated from the strand and straightened without change to the wire

surface. Single wire test pieces which are not straightened in the production process shall be straightened, prior to measurement, without change to the wire surface.

13.3.2.2 Depth at the deepest point (a_{max})

The indentation depth at the deepest point (a_{max}) shall be determined by measuring the depth of n ($n \geqslant 5$) individual indentations in each row at their deepest point and calculating the mean of the individual values obtained.

13.3.2.3 Indentation spacing (c)

The indentation spacing (c) shall be determined from the length of the measured distance divided by the number of the protrusions between indentations included in it.

The measured distance is deemed to be the interval between the centre of an indentation and the centre of another indentation on the same row of the product determined in a straight line and parallel to the longitudinal axis of the product. The length of the measured distance shall be at least 10 protrusions between indentations.

13.3.2.4 Part of the circumference without indentations (Σe_i)

The part of the circumference without indentations (Σe_i) shall be determined as the sum of the average gap between indentations of two adjacent indentation rows, for each indentation row. The average gaps shall be determined from at least 3 measurements.

13.3.2.5 Indentation angle (β)

The indentation angle (β) shall be determined as the mean of the individual angles measured for each indentation row.

13.3.3 Lay length of strand (P)

The lay length of strand (P) shall be determined as the distance between two consecutive corresponding points of the same wire.

NOTE   It is recommended that this distance be measured on paper on to which an impression of the strand is made by rubbing.

13.3.4 Straightness

The bow height (h_b) which indicates the straightness of the product shall be determined by measuring in the plane of the bow the distance between the prestressing steel and the line joining the ends of two fixed supports 1 m apart, on to which the prestressing steel is placed (see Figure 7).

Figure 7 — Measurement of bow height

19

14 Determination of the relative rib area (f_R)

14.1 General

The determination of the relative rib area (f_R) shall be carried out using the results of measurements made according to 13.3.1

14.2 Calculation of f_R

The relative rib area is defined by the following formula:

$$f_R = \frac{1}{\pi d} \sum_{i=1}^{n} \frac{\frac{1}{m} \sum_{j=1}^{m} F_{R,i,j} \sin \beta_{i,j}}{c_i}$$

where

n is the number of rows of transverse ribs on the circumference;

m is the number of different transverse rib inclinations per row;

$F_R = \sum_{i=1}^{p} (a_{s,i} \Delta l)$ is the area of the longitudinal section of one rib (see Figure 8).

Figure 8 — Determination of the area of the longitudinal section F_R

Where the general formulae given above are not strictly applied by using special devices, a simplified formula may be used.

Examples of simplified formulae are as follows:

a) Trapezium formula:

$$f_R = (a_{1/4} + a_m + a_{3/4})(\pi d - \sum e_i)\frac{1}{4\pi d c}$$

b) Simpson's rule formula:

$$f_R = (2a_{1/4} + a_m + 2a_{3/4})(\pi d - \sum e_i)\frac{1}{6\pi d c}$$

c) Parabola formula:

$$f_R = \frac{2a_m}{3\pi d c}(\pi d - \sum e_i)$$

d) Empirical formula:

$f_R = \lambda\frac{a_m}{c}$, where λ is an empirical factor that may be shown to relate f_R to a particular wire profile.

The values $a_{1/4}$, a_m, $a_{3/4}$ shall be determined according to 13.3.1.2. Σf_i shall be determined as indicated in 13.3.1.4.

The formula used for the calculation of f_R shall be stated in the test report.

15 Determination of deviation from nominal mass per metre

15.1 Test piece

In addition to the general provisions given in clause 4, the test pieces shall have square cut ends.

15.2 Accuracy of measurement

The length and the mass of the test piece shall be measured with an accuracy of at least $\pm$ 0,5 %.

15.3 Test procedure

The percentage deviation from nominal mass per metre shall be determined from the difference between the actual mass per metre of the test piece deduced from its mass and length and its nominal mass per metre as given by the relevant product standard.

16 Test report

The test report shall include the following information:

a) reference to this part of ISO 15630, i.e. ISO 15630-3;

b) identification of the test piece (including the nominal diameter of the bar, wire or strand);

c)   length of the test piece;

d)   the type of test carried out and the relevant test results;

e)   the relevant product standard, when applicable;

f)   any complementary useful information concerning the test piece, test equipment and procedure.

Annex ZA
(normative)

**Normative references to international publications
with their relevant European publications**

This European Standard incorporates by dated or undated reference, provisions from other publications. These normative references are cited at the appropriate places in the text and the publications are listed hereafter. For dated references, subsequent amendments to or revisions of any of these publications apply to this European Standard only when incorporated in it by amendment or revision. For undated references the latest edition of the publication referred to applies (including amendments).

NOTE Where an International Publication has been modified by common modifications, indicated by (mod.), the relevant EN/HD applies.

BSI — British Standards Institution

BSI is the independent national body responsible for preparing
British Standards. It presents the UK view on standards in Europe and at the
international level. It is incorporated by Royal Charter.

Revisions

British Standards are updated by amendment or revision. Users of
British Standards should make sure that they possess the latest amendments or
editions.

It is the constant aim of BSI to improve the quality of our products and services.
We would be grateful if anyone finding an inaccuracy or ambiguity while using
this British Standard would inform the Secretary of the technical committee
responsible, the identity of which can be found on the inside front cover.
Tel: +44 (0)20 8996 9000. Fax: +44 (0)20 8996 7400.

BSI offers members an individual updating service called PLUS which ensures
that subscribers automatically receive the latest editions of standards.

Buying standards

Orders for all BSI, international and foreign standards publications should be
addressed to Customer Services. Tel: +44 (0)20 8996 9001.
Fax: +44 (0)20 8996 7001. Email: orders@bsi-global.com. Standards are also
available from the BSI website at http://www.bsi-global.com.

In response to orders for international standards, it is BSI policy to supply the
BSI implementation of those that have been published as British Standards,
unless otherwise requested.

Information on standards

BSI provides a wide range of information on national, European and
international standards through its Library and its Technical Help to Exporters
Service. Various BSI electronic information services are also available which give
details on all its products and services. Contact the Information Centre.
Tel: +44 (0)20 8996 7111. Fax: +44 (0)20 8996 7048. Email: info@bsi-global.com.

Subscribing members of BSI are kept up to date with standards developments
and receive substantial discounts on the purchase price of standards. For details
of these and other benefits contact Membership Administration.
Tel: +44 (0)20 8996 7002. Fax: +44 (0)20 8996 7001.
Email: membership@bsi-global.com.

Information regarding online access to British Standards via British Standards
Online can be found at http://www.bsi-global.com/bsonline.

Further information about BSI is available on the BSI website at
http://www.bsi-global.com.

Copyright

Copyright subsists in all BSI publications. BSI also holds the copyright, in the
UK, of the publications of the international standardization bodies. Except as
permitted under the Copyright, Designs and Patents Act 1988 no extract may be
